

Parameterize Requests:

How to use variables with parameters

Response of a parameterized request

The image consists of two screenshots of the Postman application interface, demonstrating how to parameterize an API request.

Top Screenshot: Shows the 'Weather' API collection with a GET request. The URL is parameterized using environment variables: `{{BaseUrl}}q={{City}}&appid=e1151fde0242327d274a99b6087525e5`. The 'Pre-request Script' tab is active, showing a script that sets the 'City' environment variable to 'Paris': `pm.environment.set("City", "Paris")`. The 'Send' button is visible.

Bottom Screenshot: Shows the 'Environments' panel with the 'Dev' environment selected. It displays a table of environment variables:

Variable	Type	Initial value	Current value
<input checked="" type="checkbox"/> BaseUrl	default		api.openweathermap.org/data/2.5/weat...
<input checked="" type="checkbox"/> City	default	Salem	Paris
Add new variable
